# A Comparative Study for Single Image Blind Deblurring Supplementary Material 

Wei-Sheng Lai ${ }^{1} \quad$ Jia-Bin Huang ${ }^{2} \quad$ Zhe Hu ${ }^{1} \quad$ Narendra Ahuja ${ }^{2} \quad$ Ming-Hsuan Yang ${ }^{1}$<br>${ }^{1}$ University of California, Merced ${ }^{2}$ University of Illinois, Urbana-Champaign<br>http://vllab.ucmerced.edu/~wlai24/cvpr16_deblur_study

## 1. Overview

In this supplementary document, we present three main additional results to complement the paper. First, we present test images in our real and synthetic datasets, and screenshots of the user study survey webpage. Second, we show complete results of the user study analysis, which include the B-T scores, grouping of algorithms, the percentage of obtained votes and the rationale analysis. Finally, we present qualitative comparisons of state-of-the-art deblurring algorithms on 10 selected blurred images from our real dataset.

## 2. Datasets

Real Dataset. We show the 100 blurred images of our real dataset in Figure 1. These images cover a wide variety of scenes and challenges for deblurring, allowing us to evaluate the deblurring algorithms in the wild.

Figure 1: All blurred images in our real dataset.

Synthetic Dataset. Our synthetic dataset consists of 25 latent images (Figure 2), 4 uniform blur kernels (Figure 3), and 4 camera trajectories, i.e., non-uniform blur kernels (Figure 4).

Figure 2: All latent images in our synthetic dataset.

(a) $51 \times 51$

(b) $75 \times 75$

(c) $75 \times 75$

(d) $101 \times 101$

Figure 3: Uniform blur kernels generated from [9]. The captions indicate the corresponding support size of the blur kernels.

Figure 4: Visualization of the local blur kernels generated from our recorded camera trajectories. The support size of the blur kernel is $25 \times 25$.

## 3. Evaluated Algorithms

In Table 1, we list the details of the evaluated algorithms, including the blur model assumptions, image priors, blur kernel priors, and the execution time under different blur kernel sizes. The execution time is measured with an image of size $800 \times 600$ on a machine with 3.6 GHz CPU and 16G RAM.

Table 1: List of the evaluated algorithms. For the blur model column, U: uniform deblurring, NU: non-uniform deblurring. For the code column, E: executable binary code, M: MATLAB M code, P: MATLAB P code.

| Method |  | Image Priors | Blur Kernel Priors | Code | Execution time (sec.) and kernel width |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | 25 | 51 | 75 | 101 |
| Fergus-06 [3] | U | mixture-of-Gaussian | mixture-of-exponential | M | 218.4 | 173.5 | 163.7 | 146.9 |

## 4. Human Subject Study

We show screenshots of our user study website in Figure 5 and 6. We first give a brief introduction to the image deblurring task and list two common artifacts (e.g. ringing artifacts, noisy images) before subjects start the survey. In our main survey page, we ask subjects to choose a preferred image from a pair of deblurred results on the screen. Our webpage allows subjects to easily flip between two images by hovering the mouse over the two thumbnails on the top, and show the magnified images in the middle of the page (see Figure 6).

## Introduction

Image deblurring is a technique to reduce blur and recover sharp and clear images. There are various deblurring algorithms that produce different results. Some of them may cause ringing artifacts, and some may generate noisy results as shown in the figures below. This survey aims at understanding the user preference of deblurred images, which is important in the field of computer vision.

Blurred

Deblurred

Ringings

Noisy

## What to do?

We will show you TWO images on the screen, and ask you to select the image you like better. Also, we will ask you to choose the reason why you prefer the selected images. It takes about 10 minutes to complete this survey.

Figure 5: A screenshot of the introduction page in our user study website.

Hover your mouse over a thumbnail to switch the magnified display to the corresponding image. Click on a thumbnail image to select the one you like better.

Magnify: Image 2

Why you select this image? You may check multiple options.

- This image is sharper/clearer
- This image has less ringings.
- This image has less noise.
- This image has less saturated regions.

This image is NOT over-sharpened.
No specific reason. This image is simply more appealing.
I can't tell the difference./I don't know which one is better.

Figure 6: A screenshot of the survey page in our user study website.

## 5. Ranking

### 5.1. Ranking from the B-T Scores

Figure 7, 8, and 9 illustrate the complete rankings from the B-T scores [1] on our real, synthetic uniform and synthetic non-uniform datasets, respectively.

Figure 7: Cumulative frequency and ranking of the B-T scores on our real dataset.

Figure 8: Cumulative frequency and ranking of the B-T scores on our synthetic uniform dataset.

Figure 9: Cumulative frequency and ranking of the B-T scores on our synthetic non-uniform dataset.

### 5.2. Ranking from Obtained Votes and Method Grouping

Figure 10, 11, and 12 show the complete rankings from the obtained votes and method grouping from the significance test on our real, synthetic uniform, and synthetic non-uniform datasets, respectively.

Figure 10: Grouping of algorithms by significance test on our real dataset.

## 6. Rationale Analysis

For each image pair, we ask subjects to choose reason(s) why they prefer the selected image. Table 2 lists the reasons available to select when comparing a pair of images. We present the percentage of chosen reasons for all the datasets in Figure 16, 17, and 18.

| ID | Reason |
| :---: | :--- |
| 1 | This image is sharper/clearer. |
| 2 | This image has less ringings. |
| 3 | This image has less noise. |
| 4 | This image has less saturated regions. |
| 5 | This image is NOT over-sharpen. |
| 6 | No specific reason. This image is simply more appealing. |
| 7 | I can't tell the difference. / I don't know which one is better. |

Table 2: Reasons for choosing a result.

| Blur | 16.5\% | 20.7\% | 18.7\% | 9.5\% | 11.7\% | 9.8\% | 13.1\% | -45 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
